

# XENA - A Warrior for Configuration Control

Why do you need XENA XER in your Primavera Toolkit? Here's why!

- To avoid XER import file problems; Many times XER files coming into the production database bring unwanted or duplicate codes and values, causing a mess in the production database. XENA solves this problem!
- To combine data from different databases into a common or reporting database
- To transition from one database structure to another for upgrades, transfers to other P6 databases, etc.
- To export Primavera projects without distributing your sensitive and confidential data such as costs, activity progress, etc. to general contractors, subcontractors, and other divisions/departments

**View an introduction video or try XENA XER for free**
